APPLICANT : SONY CORP;

INVENTOR : YAMAMOTO HITOSHI;

INT.CL. : G05B 19/05

TITLE : ELECTRONIC EQUIPMENT

ABSTRACT : PROBLEM TO BE SOLVED: To prevent the start of a timer that occurs against the user's will by controlling the start of the timer which turns on and off a power supply in response to the ON/OFF states of a key holding function that invalidates the key input.

SOLUTION: When the actuation time information showing the power rise and/or breaking time is inputted via a timer setting key 2D, a CPU 3 stores this input information and also compares it with the time information stored in the CPU 3 itself. Then the CPU 3 waits for the actuation time and then sends a control signal to a power supply 4 at the set actuation time, so that the power supply 4 is compulsively turned on or off. Furthermore, the CPU 3 inputs the operation information on a key holding key 2E and invalidates all operations of an input part when the key 2E is turned on. When the key 2E is actually turned on, the CPU 3 carries out a timer control processing procedure to control the timer function under a prescribed condition.
